AI –Based Employee Wellness Management Platform

Support Employee's Mental Health and Sentiment Remotely

Presented By:

Team 4

Shivendra Tripathi
Sudip Madhu**

Problem Statement

→ Current System's Limitations and Issues

- Lack of a secure and centralized login and wellness management system.
- Difficulty in managing user/admin access and employee wellness records.
- Limited real-time analysis of workforce performance and health trends.
- Need for instant wellness guidance through an intelligent chatbot with natural language response.

Introduction

→ **Knowing about the Project**

- Employee wellness is essential for strong productivity and steady growth. The system helps manage health data and spot risks like stress while offering personal wellness tips.
- Employee wellness plays a big role in performance and growth. This system handles health data, predicts risks, and gives each person wellness ideas that support their wellbeing.
- Supporting employee wellness leads to better focus and stronger results. The system works with wellness data, identifies stress risks, and shares recommendations and the sentiment to help everyone stay healthy.

Project Objective

→ Objectives of the Project

1. Personalized Employee Dashboards: Tracks vitals, sets goals, and delivers custom AI insights.
2. Proactive Admin Analytics: Enables predictive risk modeling, sentiment tracking, and key KPIs.
3. 24/7 AI Wellness Assistant: Provides instant, contextual advice on diet, stress, and exercise.
4. Secure & Scalable Infrastructure: Ensures data privacy, role-based access, and centralized analytics.
5. Automated Admin & Emergency Response: Streamlines claims, scheduling, and instant SOS alerts.

System Architecture

Explaining the structure and flow of the system.

- The application is built on a modern, decoupled architecture, commonly known as a Backend for Frontend (BFF) pattern.
- This means the React frontend is a distinct application that communicates with a dedicated Flask backend via a REST API
- Microservice-Ready AI Integration: Isolates LLM interactions and machine learning model inference into modular background services to maintain high responsiveness and system efficiency.
- Stateless Token Authentication: Utilizes secure JWT authorization across API requests, ensuring strict role-based access control and seamless horizontal scaling.

Methodology

→ How the system was developed and works step-by-step.

- The system was developed in a modular way, starting with secure user authentication and role-based access for employees and admins.
- After that, the frontend, backend, and database were connected to manage wellness records, analytics, and user interactions smoothly.
- Finally, AI-based features such as risk prediction, recommendations, sentiment analysis, performance analytics, and chatbot support were added to make the platform smarter and more useful.

User Authentication Flow

→ Employee Journey

- Auth & Profile: User registers/logs in using JWT authentication → Dashboard loads.
- Data Input: User logs daily habits, sleep, exercise, and mental health feedback.
- Interaction: User requests personalized meal/fitness plans or chats with the InfyWell AI Assistant.
- Action & Emergency: User books checkup appointments or triggers an Emergency SOS alert.

Admin Flow

→ HR/Management Overview

- Dashboard Access: Admin authenticates → Views organization-wide health records and department filters.
- Analytics Monitoring: Admin monitors burnout risk trends, absenteeism rates (3.6%), and overall workforce risk metrics.
- System Management: Admin adjusts risk thresholds (e.g., High Risk = 70), configures privacy settings, manages insurance claims, and sends broadcast notifications.
- Emergency Handling: Admin receives real-time SOS alerts and health checkup logs.

AI Chat Interaction Flow

Data Processing Engine

- Data Ingestion: Collects raw health metrics, BMI, blood pressure, and text feedback from MongoDB.
- Inference Pipeline:
- ML Models (Random Forest/Decision Tree): Calculates risk severity scores (<45% Low, 45-60% Moderate, >75% High).
- NLP Engine: Performs sentiment and emotion analysis on employee feedback/logs.
- Ollama LLM Service: Ingests health context and user prompts to generate personalized daily tips, diets, and conversational advice.
- Output Delivery: Renders predicted risks and recommendations back to React Frontend dashboards in real time.

Core

Modules

Login & SignUp Module

SignUp and SignIn

- User login with email and password.
- User registration with required fields.
- Remember me option in login form.
- Forgot password flow with email, OTP, and reset password steps in the frontend prototype.
- Role-based redirect to user or admin dashboard after authentication.

Database

➔ Database Management of the Employee Data

The backend connects to MongoDB using PyMongo.

User-related data is stored in collections including admin and employees in JSON – like format.

Health Records Collection

- Collecting the Health Record
- BMI and medical reports.
 - Exercise and sleep tracking.
 - Attendance and assessments.
 - Data preprocessing and validation.

Employee Health Data Management

Database logs for tracking key metrics including BMI, medical stats, sleep, and lifestyle routines.

Wellness Risk Prediction

→ Predicting the Risk

- Predicts stress and burnout.
- Detects obesity and hypertension risk.
- Uses historical and real-time data.
- ML: Decision Tree, Random Forest

MODULE 2 OF 5

Wellness Risk Prediction

Machine learning assessments predicting health risks, cardiovascular issues, or stress burnout.

HIGH SEVERITY

0 Score $\geq 70\%$

Critical risk indicators. Immediate clinical review or stress PTO mandated.

MODERATE SEVERITY

0 Score 45-69%

Elevated stress triggers. Guided meditation and ergonomic desk updates advised.

LOW SEVERITY

3 Score $< 45\%$

Healthy baseline. Maintain current lifestyle routines and claim fitness rewards.

Filter risk records by clinical severity:

All Risks (3)

High (0)

Moderate (0)

Low (3)

Rishit Ranjan

EMP101

LOW SEVERITY
Category

Risk Intensity Index: 42%

TRIGGERS DETECTED

Vitals check within ideal levels

PRESCRIBED ACTION

Low risk profile. Maintain current healthy routines and continue periodic monitoring.

Shiv

EMP103

LOW SEVERITY
Category

Risk Intensity Index: 41%

TRIGGERS DETECTED

Vitals check within ideal levels

PRESCRIBED ACTION

Low risk profile. Maintain current healthy routines and continue periodic monitoring.

Sudip Madhu

EMP102

LOW SEVERITY
Category

Risk Intensity Index: 30%

TRIGGERS DETECTED

Vitals check within ideal levels

PRESCRIBED ACTION

Low risk profile. Maintain current healthy routines and continue periodic monitoring.

Personalized Wellness Recommendation

Wellness Recommendation System

Tailored, evidence-based fitness routines, diet schedules, and mental wellbeing recommendations.

🔍 Search by employee name or ID...

EMP101

Low Risk

MENTAL WELLNESS

Guided Meditation Routine

10-15 minutes of guided mindfulness daily.

REASONS:

- Matches low-risk wellness profile

LIFESTYLE

Sleep Hygiene Program

Consistent bedtime routines and screen-free zones.

REASONS:

- Matches low-risk wellness profile

DIET

High-Protein Lean Macro Guide

Nutritional breakdown focusing on preservation of muscle tissue.

REASONS:

- Matches low-risk wellness profile
- Exercise can be improved further

Employee Wellness Recommendation

- Personalized fitness plans
- Diet and lifestyle suggestions
- Mental wellness and yoga activities
- AI: collaborative filtering, content-based filtering, Generative AI

Mental Health & Sentiment Analysis

Mental Health & Sentiment Analytics

NLP-driven individual stress analytics collected through fully anonymized feedback pulse-checks.

Analytics Active

Individual Employee Sentiment

➔ Sentiment and Mental Health

- Analyzes surveys and feedback.
- Can use emails with consent and chatbot conversations
- Detects stress, anxiety, burnout.
- NLP, sentiment analysis, emotion detection

Performance & AI Analysis

Employee Performance Metrics

- Tracks absenteeism and workforce health risk.
- Measures wellness program effectiveness.
- Helps admin monitor employee performance trends.

Chatbot Module

➔ Chatbot Support and Assistance

- AI-powered wellness assistant for employees.
- Answers questions on sleep, diet, exercise, stress, and burnout.
- Provides interactive chat support inside the user dashboard.

Additional

Features

Admin Dashboard

Insurance Management
Notification Center

AI Wellness Assistant

AI Meals and Diet Plans

Health Reports and Timeline

Health Checkups

Emergency SOS trigger alert

Health Expenses claims

Conclusion

- The project includes secure authentication, database integration, risk prediction, recommendation, sentimental analysis, performance analytics, and an AI wellness chatbot in one platform.
- It supports both employee and admin roles for managing wellness data and system features.
- These modules make the system more intelligent, interactive, and useful for future expansion.
- Modular Scalability: Designed with an extensible architecture that allows seamless integration of future health-tech tools and wearable devices.
- Real-time Incident Response: Combines continuous health metric tracking with automated SOS triggers and expense management for rapid emergency handling.
